FINAL REPORT
SYNTHETIC APERTURE
RADAR CORRELATOR
PHASE HISTORIES

December 1977

Perkin-Elmer Report Number 6590

Prepared For
Jet Propulsion Laboratories
Pasadena, California

PERKIN-ELMER

This report is submitted in compliance with JPL Contract No. 954582.

It supplements the design of the following subsystems:

1. Zoom azimuth telescope, zooming range from 3X to 6X.
2. Range curvature correcting lenses.
3. Sphero-cylindrical shift lens.
4. Auxiliary lenses (tilted cylinder and matching lens)

These subsystems were designed to work with the Base Plant Correlator.

Two phase histories are analyzed in this report, which are labeled PHASE G and PHASE I. The parameters of these are:

	PHASE G	PHASE I
A	4.3	4.3
K_1	4.0696×10^5	4.0696×10^5
K_2	0.39062	0.39062
K_3	-4.5573×10^3	-4.5573×10^3
K_4	1.5748	1.5748
K_5	0	1645.0
r_o	109.6	109.6
x_{min}	-1.65	-1.65
x_{mx}	1.65	1.65
y	0.665	0.665
r_c	110.6	110.6

TABLE OF CONTENTS

PART I

SPECIFICATION OF THE CORRELATOR AND SUBSYSTEMS

Notes on the Computer Printout

(1) The first column gives the surface number and type:

SPH denotes a spherical surface
CYL denotes a cylindrical surface

For these the next column indicates the radius which is printed at the center of the column in the case of a spherical surface. The radius of a cylindrical surface with horizontal axis is printed displaced to the left, and when the axis is vertical the radius is printed displaced to the right.

(2) Some of these "surfaces" are not actual optical surfaces as

RPH denoting radar phase history

The parameters of the phase history are found after the list of surfaces under the title "TABLE OF CONSTANTS". These parameters are printed in the following order

K_1 K_2 K_3 R_c $2\pi K_5/K_4$

(3) Other "surfaces" actually denote rotation and translation in the coordinate axis, in particular

RTN denotes rotation

with the value of the angle given in radians, printed to the left for rotation about a horizontal axis and printed to the right for a rotation about a vertical axis.

(4) The third column indicates the axial separation between consecutive surfaces. The last column gives the relative position of each surface with respect to the image surface or output plane.

(5) Columns 4,5,6 specify refractive indices for the optical glasses used in the lens elements. The glass code appears in column 7 and the glass name in column 8.

(6) Columns 9 and 10 indicate the half-clear aperture of each surface.

PART II

EVALUATION OF WAVE ABERRATION IN TERMS OF LEGENDRE POLYNOMIALS

NOTES

In optical systems where the aperture is square or rectangular the wave aberration function $W(x,y)$ can be expanded in terms of Legendre orthogonal polynomials

$$W(x,y) = \Sigma\Sigma\ A'_{nm}\ P_n(x)\ P_m(y)$$

where x,y are rectangular coordinates in the exit pupil normalized to an extreme value of unity and P_n , P_m are Legendre polynomials of order n and m respectively. In practice even if the series is truncated beyond terms where m+n=8, the expansion provides an excellent approximation.

The advantage of this polynomial expansion is that the Strehl Intensity Ratio, SIR, is related to the coefficients of the expansion by the formula

$$SIR = 1 - 4\pi^2\Sigma\Sigma A_{nm}^2$$

where

$$A_{nm} = A'_{nm}/\sqrt{(2n+1)(2m+1)}$$

A system where SIR>80% is generally considered as an acceptable performance, hence

$$\sqrt{\Sigma\Sigma A_{nm}^2} < 0.07\lambda$$

Therefore any aberration coefficient $A_{nm}>0.07\lambda$ denotes a large aberration.
